

Integrated Efficiency[®]

Integrating energy solutions for maximum savings & sustainability

Commercial profitability is a simple equation, revenue in versus expenses out. Energy is one of the largest expenditures a company can have, and a key variable in maintaining control and balance of this equation. Achieving favorable energy rates is typically a great starting point, but you also have to look at energy reductions. With our customizable Integrated Efficiency (IE) program, we tailor solutions by integrating your electricity contract with energy efficiency projects. By reducing your energy spend and consumption, your business will be primed for meeting or exceeding your corporate sustainability objectives.

How It Works

- 1 We begin by assessing your organization's overall energy consumption.
- 2 Our team of engineers develop a customized solution and make efficiency recommendations to best meet your company's unique goals and requirements.
- 3 Your efficiency solutions project is then expertly executed to maximize energy conservation, with no upfront cost.
- 4 With your new equipment and systems in place, the savings reflected in your monthly bill will then help offset the costs of the project.
- 5 Your organization continues to capture savings and ultimately achieve energy and sustainability goals.

For illustration purposes only.

Integrated Efficiency is an on-bill program designed to maximize energy efficiency and lower your energy spend.

Commodity + Energy Project = One Bill

Benefits of Integrated Efficiency

- No initial cash outlay*
- Reduced energy consumption = Increased savings
- Integrated billing means one provider and invoice for both electricity and project costs
- Avoid maintenance interruptions
- Potential tax benefits
- No penalty for early payment
